REGEIVED CENTHAL PAX CENTER

PATENT Docket No. 28944/40163

MAR 25 2008

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application.

- 1. (currently amended) Voltage shift control circuit intended to be placed in parallel with at least one series voltage shift capacitor coupling the phase comparator and the voltage controlled oscillator of a phase locked loop and comprising:
 - an input, intended to be coupled with the output of the phase comparator;
 - an output, intended to be coupled with the input of the voltage controlled oscillator;
- controlled charging means, designed to charge the voltage shift capacitor according to a control signal;
- controlled pre-charging means, designed to accelerate the charging of the voltage shift capacitor by the controlled charging means; and
- controlled polarization means, designed to ensure the polarization of the input during the pre-charging of the voltage shift capacitor.
- 2. (previously presented) Circuit according to Claim 1, wherein the controlled charging means comprise a first operational amplifier connected as a voltage follower between the input and the output, a resistor placed in the feedback loop of the operational amplifier, and a controlled current source supplying a current of specified value through said resistor.
- 3. (previously presented) Circuit according to Claim 2, wherein the operational amplifier of the charging means comprise a push-pull output stage, and wherein the charging means further comprise a resistor of high value connected in series between the output of the operational amplifier and the output of the circuit.
- 4. (previously presented) Circuit according to Claim 3, wherein the controlled pre-charging means comprise a push-pull stage which, in the activation of the pre-charging means configuration,

PATENT Docket No. 28944/40163

is arranged as a mirror with respect to the push-pull output stage of the operational amplifier of the charging means, in such a way as to short-circuit the high value resistor.

- 5. (original) Circuit according to Claim 4, wherein the push-pull stage of the pre-charging means is designed to deliver a current higher than the current delivered by the push-pull output stage of the operational amplifier of the charging means.
- 6. (previously previously) Circuit according to Claim 1, wherein the controlled polarization means comprise a second operational amplifier connected as a voltage follower which, in the activation of the controlled polarization means configuration, is arranged to impose a common mode voltage on the input of the circuit.
- 7. (previously presented) Circuit according to Claim 1, further comprising means for deactivating the controlled pre-charging means before the controlled polarization means.
- 8. (previously presented) Circuit according to Claim 2, further comprising an additional controlled push-pull stage whose output is intended to be connected to the centre point of an RC network of a loop filter of the PLL and which, in the activation configuration, is connected as a mirror with respect to the push-pull stage of the controlled pre-charging means and with respect to the push-pull output stage of the operational amplifier of the charging means.
- 9. (original) Circuit according to Claim 8, wherein the additional controlled push-pull stage is integrated with the operational amplifier of the charging means.
 - 10. (previously presented) Circuit according to Claim1, designed in CMOS technology.
- 11. (currently amended) Phase locked loop comprising a phase or frequency comparator, a loop filter, a voltage controlled oscillator, a series voltage shift capacitor connecting the phase

PATENT Docket No. 28944/40163

comparator and the voltage controlled oscillator, and a voltage shift control circuit according to Claim 1 placed in parallel with the series voltage shift capacitor and comprising:

- an input, intended to be coupled with the output of the phase comparator;
- an output, intended to be coupled with the input of the voltage controlled oscillator;
- controlled charging means, designed to charge the voltage shift capacitor according to a control signal;
- controlled pre-charging means, designed to accelerate the charging of the voltage shift capacitor by the controlled charging means; and
- controlled polarization means, designed to ensure the polarization of the input during the pre-charging of the voltage shift capacitor.
- 12. (currently amended) Radio-frequency transmitter, having a phase locked loop for generating a radio-frequency signal to be transmitted, said phase locked loop comprising a phase or frequency comparator, a loop filter, a voltage controlled oscillator, a <u>series</u> voltage shift capacitor connecting the phase comparator and the voltage controlled oscillator, and a voltage shift control circuit according to Claim 1 placed in parallel with the <u>series</u> voltage shift capacitor and comprising:
 - an input, intended to be coupled with the output of the phase comparator;
 - an output, intended to be coupled with the input of the voltage controlled oscillator;
- controlled charging means, designed to charge the voltage shift capacitor according to a control signal;
- controlled pre-charging means, designed to accelerate the charging of the voltage shift capacitor by the controlled charging means; and
- controlled polarization means, designed to ensure the polarization of the input during the pre-charging of the voltage shift capacitor.
- 13. (currently amended) Mobile terminal of a radio-communications system with a radio-frequency transmitter having a phase locked loop for generating a radio-frequency signal to be transmitted, said phase locked loop comprising a phase or frequency comparator, a loop filter, a

PATENT Docket No. 28944/40163

voltage controlled oscillator, a <u>series</u> voltage shift capacitor connecting the phase comparator and the voltage controlled oscillator, and a voltage shift control circuit according to claim 1 placed in parallel with the <u>series</u> voltage shift capacitor and comprising:

- an input, intended to be coupled with the output of the phase comparator;
- an output, intended to be coupled with the input of the voltage controlled oscillator;
- controlled charging means, designed to charge the voltage shift capacitor according to a control signal;
- controlled pre-charging means, designed to accelerate the charging of the voltage shift capacitor by the controlled charging means; and
- controlled polarization means, designed to ensure the polarization of the input during the pre-charging of the voltage shift capacitor.
- 14. (currently amended) Base station of a radio-communications system with a radio-frequency transmitter having a phase locked loop for generating a radio-frequency signal to be transmitted, said phase locked loop comprising a phase or frequency comparator, a loop filter, a voltage controlled oscillator, a voltage shift capacitor connecting the phase comparator and the voltage controlled oscillator, and a <u>series</u> voltage shift control circuit according to Claim 1 placed in parallel with series the voltage shift capacitor and comprising:
 - an input, intended to be coupled with the output of the phase comparator;
 - an output, intended to be coupled with the input of the voltage controlled oscillator;
- controlled charging means, designed to charge the voltage shift capacitor according to a control signal;
- controlled pre-charging means, designed to accelerate the charging of the voltage shift capacitor by the controlled charging means; and
- controlled polarization means, designed to ensure the polarization of the input during the pre-charging of the voltage shift capacitor.
